[Home < https://www.wcrf.org/>](https://www.wcrf.org/) - [Cancer trends < https://www.wcrf.org/cancer-trends/>](https://www.wcrf.org/cancer-trends/) - Global cancer data by country

Global cancer data by country

Exploring which countries have the highest cancer rates and why.

On this page you can find incidence and mortality rates for all cancers.

Initially we include non-melanoma skin cancer (NMSC) — to give a clear picture of total cancers globally — then further tables with NMSC excluded.

A total of 19,976,499 cases of cancer were diagnosed in 2022. The age-standardised rate for all cancers for men and women combined was 196.9 per 100,000 in 2022. The rate was higher for men (212.6 per 100,000) than women (186.3 per 100,000).

When non-melanoma skin cancer was excluded the number of cancers globally dropped to 18,741,066 with a rate of 186.5 per 100,000. For men the figure was 9,566,825 with a rate of 198.6 and for women, 9,175,141 with a rate of 178.9.

With the burden growing in almost every country, preventing cancer is a significant public health challenge. Around 40% of cancer cases could be prevented by tackling risk factors relating to diet, nutrition and physical activity — for more information see our Cancer Prevention Recommendations.

Reducing the cancer burden requires concerted and integrated action across society, including civil society, private sector, and health and other professions. Browse our policy section to see how we're working with others to help make this happen.

ASR = age-standardised rates. These are a summary measure of the rate of disease that a population would have if it had a standard age structure. Standardisation is necessary when comparing populations that differ with respect to age because age has a powerful influence on the risk of dying from cancer.

Global cancer incidence: both sexes

The highest cancer rate for men and women combined was in Australia at 462.5 people per 100,000 when all cancers were included.

This changed to Denmark when NMSC was excluded (349.8 per 100,000). A further table below includes global cancer incidence excluding NMSC.

There were several countries for which the age-standardised rate was at least 300 per 100,000 when NMSC was excluded including:

- United States of America
- France
- Ireland

Global cancer incidence in both sexes including non-melanoma skin cancer

Both Sexes	Number	ASR (World)

Cancer incidence in men

The highest cancer rate among men was found in Australia at 514.3 per 100,000. This changed to Lithuania when NMSC was excluded (386.4 per 100,000). Several countries had age-standardised rate of at least 300 per 100,000, including:

- United Kingdom
- The Netherland
- Spain
- United States of America

Cancer incidence in women

The highest cancer rate in women was in Australia at 415.2 per 100,000. This changed to Denmark when NMSC was excluded (340.8 per 100,000). Several countries had age-standardised rate of at least 300 per 100,000, including:

- Norway
- The Netherlands
- Australia

Global cancer mortality: both sexes

The highest rate of cancer deaths for men and women combined was in Mongolia at 181.5 people per 100,000. When NMSC was excluded, Mongolia still had the highest rate at 181.3. The age-standardised rate was at least 130 per 100,000 in four countries:

- Zimbabwe
- Hungary
- Poland
- Romania
